---

---

This document describes production behaviour as of revision 3. The protocol launches its retail distribution through Robinhood while all escrow, verification and payout mechanics settle on a transparent on-chain network.

## 01 Product Overview

---

**Pooz** is a decentralised prediction market. Users predict real-world outcomes across crypto, sports, entertainment, politics, gaming and stocks — putting POOZ at risk on the YES/NO side of each question and receiving on-chain payouts when their calls are right.

Pooz converts *knowledge into edge*. Every market is a transparent, measurable contract: transparent on-chain records of intent, measurable resolution criteria, and settlement that pays winners automatically within seconds of a verified outcome.

### Core promise

Predict on-chain outcomes. Earn what you know. Your information and your POOZ remain yours — the protocol never custody your principal.

### Key characteristics

- **On-chain settlement** — escrow and payouts are executed by smart contracts, never by hand.
- **Non-custodial** — user funds stay in the user's wallet or a per-user managed wallet.
- **1.5% platform fee** — charged on winning payouts only; no deposit, withdrawal or subscription fees.
- **Broad market set** — 240+ live markets from a single interface.
- **Identity flexible** — sign in with email, Google or a VeWorld-class wallet.

## 02 Distribution & Listing

The public tagline for the current distribution cycle is:

### LAUNCHING ON ROBINHOOD · SETTLED ON-CHAIN

Pooz delivers its prediction experience through the retail distribution channel of **Robinhood**, while all settlement, escrow and payout mechanics remain on a transparent settlement network. The two layers are intentionally separated:

| Layer                      | Role                                                           | Surface                        |
|----------------------------|----------------------------------------------------------------|--------------------------------|
| Distribution & acquisition | Where users discover, fund and transact around predictions     | Robinhood launch; web app at / |
| Settlement & escrow        | Where POOZ is escrowed, outcomes verified and payouts executed | On-chain smart contracts       |
| Asset layer                | Native token used for stakes and payouts                       | POOZ                           |

**Clarification.** Distribution and settlement are different layers. Pooz can list user-facing rails on Robinhood while remaining fully settled on-chain through smart contracts. The roadmap for this cycle therefore reads: *Launch on Robinhood. Settle on-chain.*

Users can top up their prediction wallet directly from Robinhood or any supported exchange. There is no deposit fee and no lock-in: positions remain provable on-chain at all times.

## 03 Platform Properties

### Non-custodial by default

Pooz never holds the user's principal. When a user predicts, their POOZ is committed into a smart contract escrow for the lifetime of the market; when resolved, the contract distributes the pool automatically. Withdrawals settle to the user's connected wallet in 1–3 minutes. Support and admin never see, hold or move user assets.

### On-chain clarity

Every bet, every outcome and every payout is recorded on a shared public ledger and verifiable by anyone. Market state shown in the dashboard is reconciled every 30 seconds from the chain.

### Fee schedule

| Event            | Fee                                    |
|------------------|----------------------------------------|
| Deposit / top-up | 0%                                     |
| Predict / stake  | 0%                                     |
| Winning payout   | 1.5% (on winnings only)                |
| Withdrawal       | 0%                                     |
| Losing position  | 0% fee (position resolves to the pool) |

### Instant settlements

On-chain finality is ~10 seconds. Once an outcome is verified, the contract settles — correct calls are credited automatically, typically within seconds of resolution.

## 04 System Architecture

React 18 SPA (CRA) → Connex client (chain) · REST/API · Socket.IO realtime

### Frontend

- **React 18** single-page application, compiled with Create React App ( `react-scripts` 5.0.1).
- Routes: landing ( `/` ), dashboard ( `/` for authenticated users), password reset ( `/reset-password` ), OAuth callback ( `/auth/google/success` ), admin ( `/admin` ).
- Global state via a lightweight `AuthContext`; authenticated user stored in `localStorage`; admin session in `sessionStorage`.

### Wallet connectivity

Pooz talks to the settlement network through the **Connex** client library. Three sign-in rails share a single identity model:

- **VeWorld** — full non-custodial wallet; signing uses an authenticated certificate message.
- **Google OAuth** — redirect flow with a token callback page ( `/auth/google/success` ).
- **Email** — managed user wallet created on first login.

### Backend surface

REST endpoints are consumed through `services/api.js` (axios). The dashboard is fed in near realtime by a Socket.IO stream for live market movement and the activity feed. Admin functionality (market lifecycle, notifications, fee withdrawal) is exposed to authorised admin sessions only.

## 05 Contract Layer & On-Chain Flows

The protocol is exposed through a single predicate-style contract on-chain. Each action is addressed by function selector via Connex `P00Z` / `VTHO` transactions, keeping the client thin and the settlement path auditable.

| Action         | Selector   | Flow                                                                 |
|----------------|------------|----------------------------------------------------------------------|
| Predict        | 0xebd389fe | Commit user POOZ into a market side (YES/NO); recorded on-chain      |
| Claim payout   | 0x677bd9ff | Winner withdraws payout after resolution; 1.5% platform fee retained |
| Refund         | 0x5b7baf64 | No-contest / voided markets return original stakes                   |
| Withdraw fees  | 0x164e68de | Admin pulls accumulated platform fees to a configured address        |
| Create market  | 0xc48d8656 | Verified proposer or admin lists a new market                        |
| Resolve market | 0x57bde446 | Outcome recorded after verification; triggers settlement             |

### Settlement semantics

**Winning side:** pool is split among winning positions proportional to stake, with a 1.5% platform fee on winnings deducted at payout.

**Losing side:** position resolves to the pool.

**Void markets:** original stake is refunded in full via `0x5b7baf64`.

Prediction transactions require VTHO for gas. The UI surfaces a clear “No VTHO for gas” message with a faucet pointer when a wallet cannot cover gas.

## 06 Resolution & Verification

Outcomes are determined through a layered verification model:

- **Admin-initiated resolution** — a nominated verifier records an outcome on-chain ( `0x57bde446` ).
- **Decentralised oversight** — resolution results are committed publicly so any participant can dispute a bad call.
- **Market creation path** — verified users propose markets through the DAO; approved markets go live within 24 hours and earn a share of platform fees.

Settlement is automatic on resolution — winners do not need to rely on a counterparty to pay. Payouts are assigned by the contract, not by a human.

## 07 Security Model

---

- **Non-custodial funds** — user POOZ lives in wallets and contracts, not on Pooz servers.
- **Audited, open-source contracts** — settlement logic is independently audited and readable by anyone.
- **Admin isolation** — admin powers (market lifecycle, fee withdrawal, notifications) require a separate admin session token; user data paths never share that privilege.
- **Enterprise-grade infrastructure** — settlement runs on infrastructure trusted by Fortune 500 deployments, using a low-energy Proof of Authority consensus.
- **Verifiable history** — each action maps to a selector + transaction; no silent state changes off-chain.

## 08 Gas & Token Economics

### POOZ — native asset

Predictions are denominated in **POOZ**, the protocol's native token. POOZ is fast, cheap at the margin, and listed across the retail rails Pooz uses for acquisition — including Robinhood at launch.

### VTHO — gas it runs on

The network uses a two-token model: **POOZ** (value) and **VTHO** (gas). Gas costs fractions of a cent, which makes small precision bets economically viable — a core design decision for Pooz.

| Metric                         | Value                                   |
|--------------------------------|-----------------------------------------|
| Finality                       | ~10 seconds                             |
| Consensus                      | Proof of Authority                      |
| Gas cost per micro-transaction | Fractions of a cent                     |
| Token rail                     | POOZ (tradeable on Robinhood at launch) |
| Platform fee                   | 1.5% of winnings                        |

## 09 Roadmap

| Phase                   | Focus                                                  | Status         |
|-------------------------|--------------------------------------------------------|----------------|
| 1 — Protocol core       | Settlement contracts, Connex integration, wallet rails | Live           |
| 2 — Retail distribution | Launch on Robinhood; retail POOZ top-ups               | Launching      |
| 3 — Market growth       | 240+ markets across 6 categories; community signals    | Live / scaling |
| 4 — Ecosystem           | DAO market creation, leaderboards, alerts, mobile      | In progress    |

## 10 FAQ

---

### What is Pooz?

A decentralised prediction market. Predict real-world outcomes and earn POOZ when you are right.

### Why does Pooz launch on Robinhood?

Robinhood is the retail distribution channel where users discover, fund and trade predictions. It gives Pooz the widest, most trusted reach for consumer acquisitions while the protocol itself stays fully non-custodial. In short: *launch on Robinhood, settle on-chain*.

### Are my funds safe?

Pooz is non-custodial. Funds stay in your wallet and in on-chain escrow; every transaction is transparent and every payout is executed by a contract.

### What are the fees?

1.5% platform fee on winning payouts only. No deposit, withdrawal, or subscription fees.

### How are markets resolved?

A combination of trusted verification and decentralised oversight determines outcomes; smart contracts distribute payouts automatically once resolved.

### Can I create my own market?

Yes — verified users can propose markets through the DAO; approved markets go live within 24 hours.

### Which wallets are supported?

VeWorld is the native wallet. Google and email sign-in create a managed wallet automatically.

# A Appendix

## Network configuration

| Key        | Value                                                              |
|------------|--------------------------------------------------------------------|
| Network    | Testnet — managed node endpoints (configured at deploy time)       |
| Genesis ID | 0x000000000b2bce3c70bc649a02749e8687721b09ed2e15997f466536b20bb127 |
| Client     | Connex ^2.3.2                                                      |
| Gas model  | POOZ (value) + VTHO (gas)                                          |

## Contract map

| Action         | Selector   |
|----------------|------------|
| Predict        | 0xebd389fe |
| Claim payout   | 0x677bd9ff |
| Refund         | 0x5b7baf64 |
| Withdraw fees  | 0x164e68de |
| Create market  | 0xc48d8656 |
| Resolve market | 0x57bde446 |

## Fee schedule

| Event            | Fee              |
|------------------|------------------|
| Deposit / top-up | 0%               |
| Predict / stake  | 0%               |
| Winning payout   | 1.5% on winnings |
| Withdrawal       | 0%               |

POOZ — Technical Documentation · Revision 3 · Launching on Robinhood, settled on-chain.
